**Senior Agentic Infrastructure Engineer | Straddle**

## Cover letter

Hi Straddle team,

One thing I learned running the NOC at Front Range Internet is that a green deploy doesn't tell you whether the service works from the outside. A valid-looking backup doesn't tell you whether it'll restore, either. That gap between a successful command and a working system is a lot of what draws me to your infrastructure role.

At FRII, I took production escalations, built diagnostics for the people who took the next shift, and moved workloads from VMware ESXi and Hyper-V into Docker and Kubernetes. At Technomancy IT, I built a release workflow that tags images from Git and checks the container and public endpoint separately. I also built a backup check that actually restores PostgreSQL into a disposable instance and verifies the tables. I like making that evidence something the next person can use, especially when an incident is still unfolding.

I use coding agents heavily, but I don't want the same process that writes a change to be the only thing that says it passed. For a platform moving money, I'd want agent permissions to match the job, production actions to have an explicit approval path, and a clear record of what ran and what it changed. That's the infrastructure I'd like to help build at Straddle.

Thanks,
Chad Koslovsky
